PRODUCT DESIGN PLAN

The Simple Voucher Wizard

A guided, plain-language way to make a coupon — built for sellers who are not techies, and for whom English is a second language.

The whole idea in one line: pick a goal, answer a few plain questions, see the real coupon card, save.

The wizard is a friendly front-door to the **same** coupon the full Marketing page already edits — never a separate system, so anything made here stays fully editable later.
Two promises run through it: **plain words** (no jargon, short sentences) and **draft-first** (nothing goes live by accident — you choose when to turn it on).

PART ONE — THE WIZARD

Make a coupon in a few simple steps

Why this is simple — the levers

- **Pick a goal, do not build from parts.** Ready-made coupon goals (welcome gift, store sale…) fill almost everything in.
- **Let the AI go first.** Describe the deal in one line and the wizard fills every box — you only check.
- **One plain question, not three checkboxes.** "How do customers get it?" replaces Public / Auto-grant / Auto-apply.
- **Auto-make the scary things** — the code is written for you (editable).
- **Smart defaults + draft-first.** Sensible values are pre-set; you save a draft and turn it on when ready.

How it starts — the front door

One friendly question before any form:

What do you want to do?

Welcome gift · **Store sale** · **A coupon anyone can use** · **Free shipping** · **Start fresh** · **Ideas from my sales**

Each goal pre-fills the whole wizard, so it becomes a series of *confirmations*. Or use the **"tell me your deal in words"** box — type "20 yuan off for new customers, first order" and the AI fills it in.

Ideas from your sales — the blank page, solved

The hardest moment for a non-technical seller is the blank page: *what* coupon, and *what number?* Their own sales answer it. The wizard reads the shop's real numbers and offers a few ready-to-use ideas — each one tied to a real figure, and each one filling in a box the seller would otherwise have to guess.

Real number from your shop	What the wizard suggests (plain)	Fills in
Average order is about ¥120	"¥20 off when you spend ¥150" — to grow baskets	spend-at-least

Real number from your shop	What the wizard suggests (plain)	Fills in
Many people buy once and never return	“¥15 off for past customers” — a gentle win-back	who gets it
Lots of new first-time buyers	“A welcome gift” — turns first orders into customers	who gets it
Your best past coupon: SUMMER10	“Run another like SUMMER10”	kind + amount
A past 30%-off cost a lot for little	“Try 15% — still strong, keeps more margin”	amount
Carts often stop near ¥90	“Free shipping over ¥100” — to recover them	kind / min
About 150 coupons used a month	“Stop after 200 uses” — to control spend	total uses

The honesty rule: every number is *measured from your real sales* — never invented. A brand-new shop with too little data sees the plain goals instead, with no made-up advice. And the wizard never suggests something a coupon cannot actually do (see Part 2).

The flow — four small screens

Forks and extra rules appear **only** when relevant. Progress is shown as gentle dots — never a lying “Step 5 of 9.”

Screen 1 — The deal

- **What do customers save?** — Money off (¥) · Percent off (%) · Free shipping (big tappable cards)
- One amount box with the unit **built in** (“¥ off” or “% off”) — so “does 20 mean ¥20 or 20%?” never happens

Screen 2 — Who gets it

- **One plain choice** replaces the three confusing checkboxes: *Comes off by itself · Anyone can use it · A welcome gift for new customers · I choose who gets it*
- Each option says, in one line, exactly what the customer experiences
- The welcome-gift path adds a single yes/no: *“Also show it on the home page?”*

Screen 3 — Rules & dates

- **Optional** — smart defaults already set; the simple path skips this entirely
- **Spend at least** (pre-filled from your average order) · **Ends on** (empty = never) · and behind “More rules”: **each person** · **stop after**

Screen 4 — Review

- A live preview of the **real coupon card** the customer will see
- A one-line plain summary + the **smart heads-up** (Part 2)
- Two buttons: **Save as draft** (the safe default) or **Save & turn on**
- An **“open the full editor”** door on every screen — the wizard is the simple mode, not a cage

Who gets it — one choice, four honest paths

This is the heart of the wizard. The old form exposed three raw checkboxes (Public / Auto-grant / Auto-apply) that combine into very different coupons. The wizard asks **one plain question** and sets the right flags itself:

The seller picks	What the customer experiences	Set for them
Comes off the price by itself	Everyone, at checkout. No code to type. If two deals fit, the customer gets the better one.	auto-apply
Anyone can use it	Shows in the app's coupon list; a code you share also works when typed.	public + label
A welcome gift for new customers	Dropped into new customers' coupons on first sign-in; they tap it at checkout.	new-signup grant
I choose who gets it	Lands in the wallets of the customers you pick. No code, not listed.	hand-grant

Every setting → where it lives (nothing dropped)

Setting (today)	Plain name	Treatment	Where
code	Code	**Auto-written**, editable (a typed code only works on a public coupon)	4
type	Kind of deal	**Pick a card**: Money off / Percent off / Free shipping	1
value	How much	One box with the unit built in (¥ or %)	1
is_public / auto_grant / auto_apply	Who gets it	**One plain choice** → the right flags set for you	2
title_en / title_cn	Label customers see	**AI writes it** in simple EN + simple CN; needed for public coupons	2 / 4
min_subtotal	Spend at least	**Pre-filled from your average order**; blank = any order	3
expires_at	Ends on	Date picker; blank = never ends; a past date is blocked	3
per_customer_limit	Each person can use it	Default **1 time** (behind "More rules")	3
max_uses	Stop after	Default **no limit**; suggest a cap from past volume	3
is_active	Draft / on	**Draft by default**; turned on at the end	4
description	—	Hidden · internal note, full editor only	hidden

Plain words, not jargon

The whole point is that a non-native English speaker can read it once and understand. Short words, no terms.

The old form said	The wizard says
Min subtotal ¥	Spend at least ¥__ to use it (blank = any order)
Per customer	Each person can use it __ time(s)

The old form said	The wizard says
Max uses	Stop after __ uses (blank = no limit)
Auto-apply · Best one wins	Comes off the price by itself
Auto-grant · New signups	A welcome gift for new customers
Public · Browseable	Anyone can use it
Value (means ¥ or % — you must know which)	¥ off / % off (the unit is shown in the box)

Safety nets for beginners

- **Brand-new shop, no sales yet** → the “ideas” row stays quiet; the plain goals carry the flow. No made-up advice.
- **Single-language shop** → the other language’s label box never appears.
- **Never an error — prevent it.** The code is auto-written; a percent over 100 is capped; an end date in the past is blocked with a plain message.
- **Draft-first, nothing goes live by accident.** A draft does nothing at all until you choose “turn it on.”
- **“Open the full editor” on every screen** — the wizard is the simple mode, not a wall.

PART TWO — WHEN COUPONS ALREADY EXIST

The smart heads-up

A real shop is never empty. The moment that separates a toy wizard from a real one is what happens when you make a coupon while others are already live. Before you turn anything on, the wizard reads your current coupons and explains — in plain words — how the new one will behave next to them.

Every situation, in plain words

Grounded in exactly how the system resolves coupons today — not invented behaviour.

Situation	What the system really does	What the wizard says
You pick a code that is already live	It is refused — live codes are protected	“You already have a coupon SUMMER and it is on. Try SUMMER2, or turn the old one off.”
You pick a code from an old, off coupon	It quietly brings that old one back and resets its count	“You used SPRING before. Saving reuses it and starts the count from zero. Use it again?”
A second ‘comes off by itself’ deal exists	Only the single best one applies — they never add up	Lists them: “Customers get the better one, not both.”
A customer also has their own coupon	Whichever saves more wins; a tie keeps the customer’s pick	“They still get whichever saves more.”
A second welcome gift exists	New customers get both in their coupons (use one per order)	“New customers will get both. Turn the old one off?”
Who a welcome gift really reaches	Brand-new customers only; returning ones are left out	“For brand-new customers. It goes into their coupons; they tap it at checkout.”
Is a public coupon ‘secret’?	No — it is listed in everyone’s coupon page	“Anyone can find this in the app, and a shared code also works.”
Percent over 100, or zero	Capped at 100; zero saves nothing	Box caps at 100; “Enter how much they save.”
Money off bigger than the order	Capped at the order total — never goes negative	“Never more than the order total.”
End date is in the past	The coupon would never apply	Blocked: “That date has passed. Pick a later one.”
Free shipping that comes off by itself	Works at checkout; the amount is known once delivery is picked	“Works at checkout. The amount shows once delivery is chosen.”
Saved as a draft	Does nothing — not applied, not listed, not given out	Safe by default; nothing happens until you turn it on
You choose ‘Save & turn on’	It changes the whole shop now (or starts for future sign-ins)	“From now on, every order that fits gets this.”

How the smart heads-up decides ‘win or lose’

For automatic deals it does not just *list* what is running — it works out, from your live coupons, where the new one actually helps:

- **“Your new 15% off wins on every order”** — so an older, smaller automatic deal will barely be used (offer to turn it off).
- **“This wins only on orders over ¥150”** — when the new deal has a higher minimum than an existing one.
- **“This minimum is above your average order”** — folding the sales numbers into the warning, not just the suggestion.

Free shipping is compared fairly by valuing it at the live delivery fee, exactly as the checkout does — so the advice matches what the customer will really get.

PART THREE — ONE HONEST LIMIT + THE BUILD

What it is, and what comes next

One honest limit: the ‘secret code’

A truly secret code you type is not supported today. In this system, a code only works when the coupon is *public* — and a public coupon is automatically shown in everyone’s coupon page. A private coupon has no working typed code at all; it can only be handed to the customers you pick.

So for now the wizard offers four honest paths, and “a code I give out” is the same as “anyone can use it” (the shared code works, but it is also listed). **Recommended small fix:** a *code-only* mode — a code that works when typed but stays hidden from the list — would add a clean fifth path. It is a small backend change, flagged here, not built in this round.

What it should not promise yet

These are real seller wishes the coupon engine cannot do today. The wizard deliberately **does not** offer them, so it never makes a promise that quietly fails — each is a future backend job:

- **Slow-day / day-of-week deals** — coupons have an end date, but no day-of-week window.
- **One-product or one-category coupons** — discounts apply to the whole cart, not a single item.
- **Scheduled or auto-sent win-backs** — there is no start date or automatic trigger, only an end date.

What is reused vs. new

Reused (low risk — already built): the whole coupon engine (kinds, eligibility, best-one-wins, grants, code reuse), the sales analytics that power the ideas, the AI text engine for codes and labels, and the EN/CN language toggle.

New build	Effort
The wizard shell + 4-screen flow + the front-door goals	Moderate
“One plain choice” that sets the eligibility flags	Small
The live coupon-card preview	Moderate
The smart heads-up (read live coupons, explain win/lose)	Moderate
Ideas-from-your-sales (read analytics, AI-phrase + rank)	Moderate
Plain-word relabel layer + simple EN/CN label writer	Small
‘Code-only’ private code mode (the fifth path)	Small (backend)

Suggested build order

v1 — the spine: front-door goals → the 4 screens → the one-plain-choice eligibility → smart defaults → live preview → the smart heads-up → draft-first. This already replaces the scary 12-field form.

Fast-follow: ideas-from-your-sales (the advisor), the “describe your deal in words” box, and the small ‘code-only’ backend mode for a true secret code.

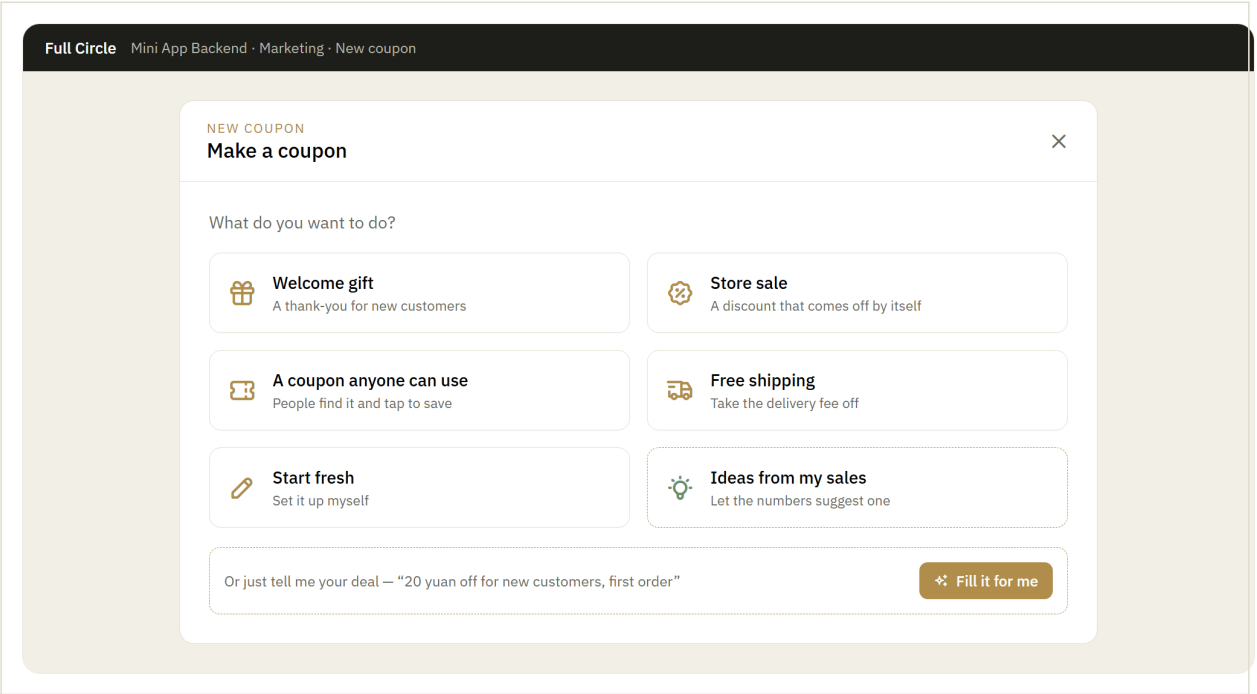

The Simple Voucher Wizard turns a 12-field form into a few plain questions — and, because it reads your live coupons and your real sales, it gives advice instead of just taking input.

THE SCREENS

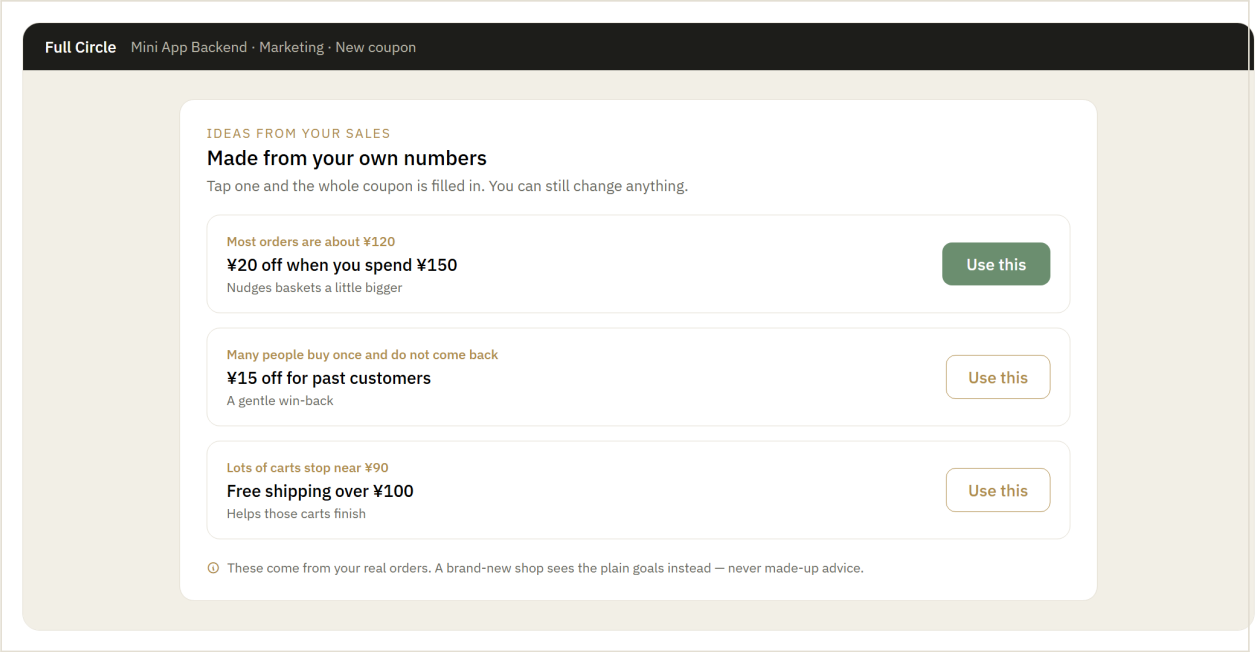

What it looks like

Mockups in the Full Circle backend palette (Ink / Brass / Tea, IBM Plex). The desktop flow has a step rail and a live preview that builds as you go; the same flow fits a phone for operators on the move.

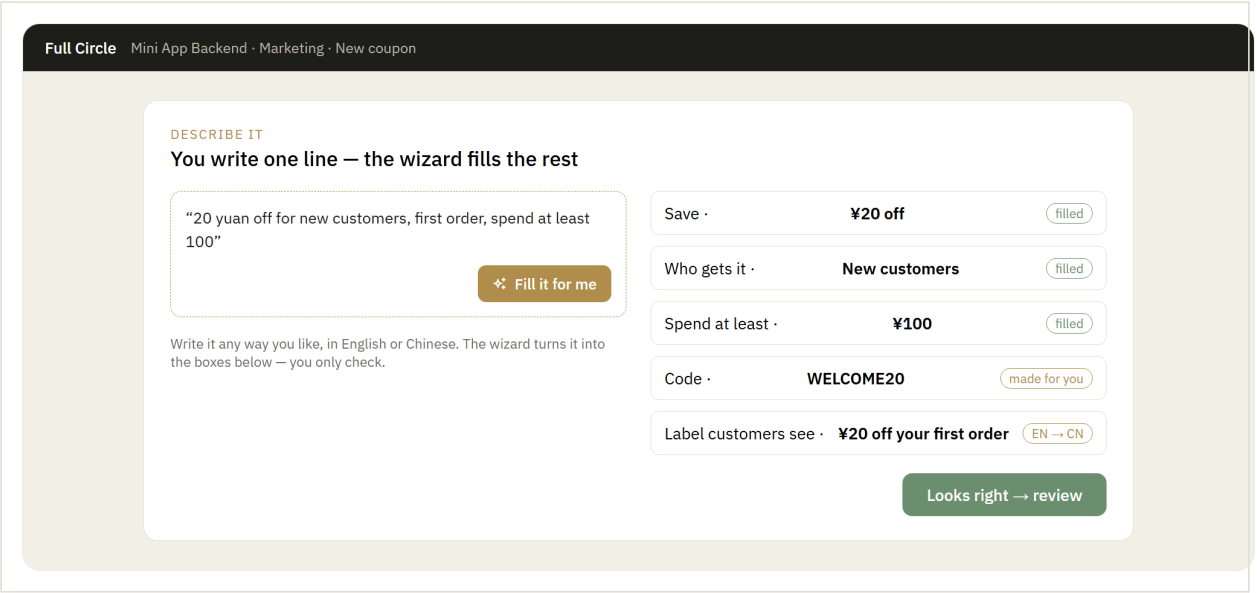

Desktop flow — screen by screen

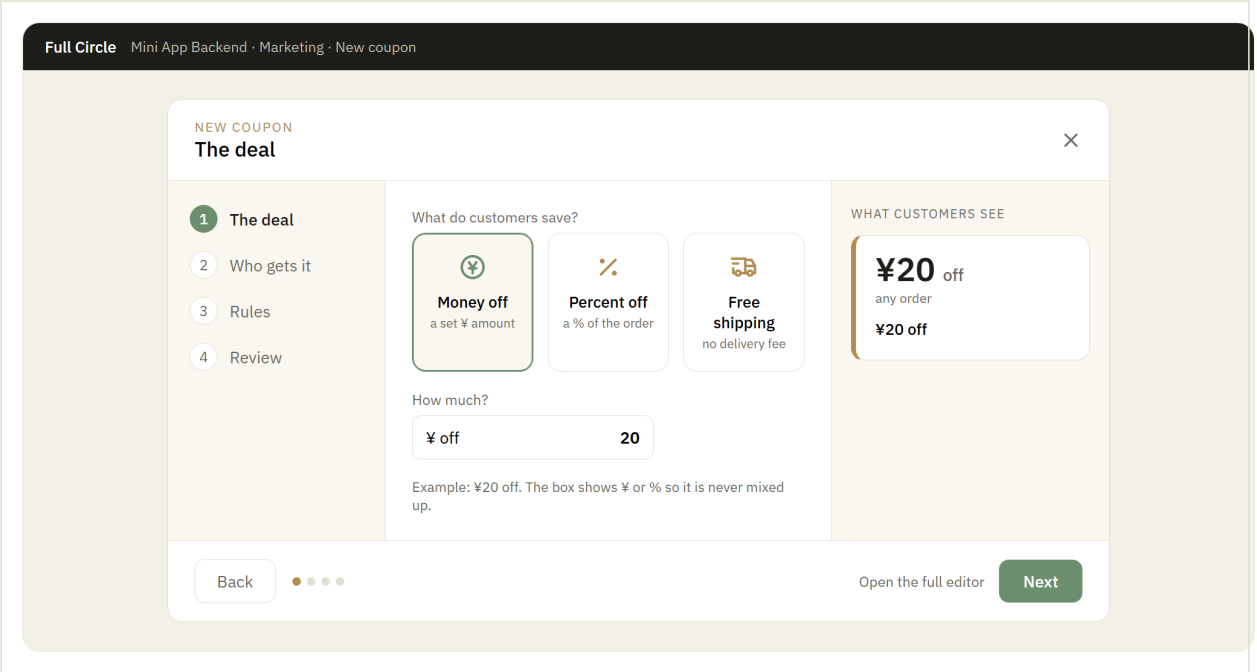

Front door — pick a goal in plain words, or just describe the deal.

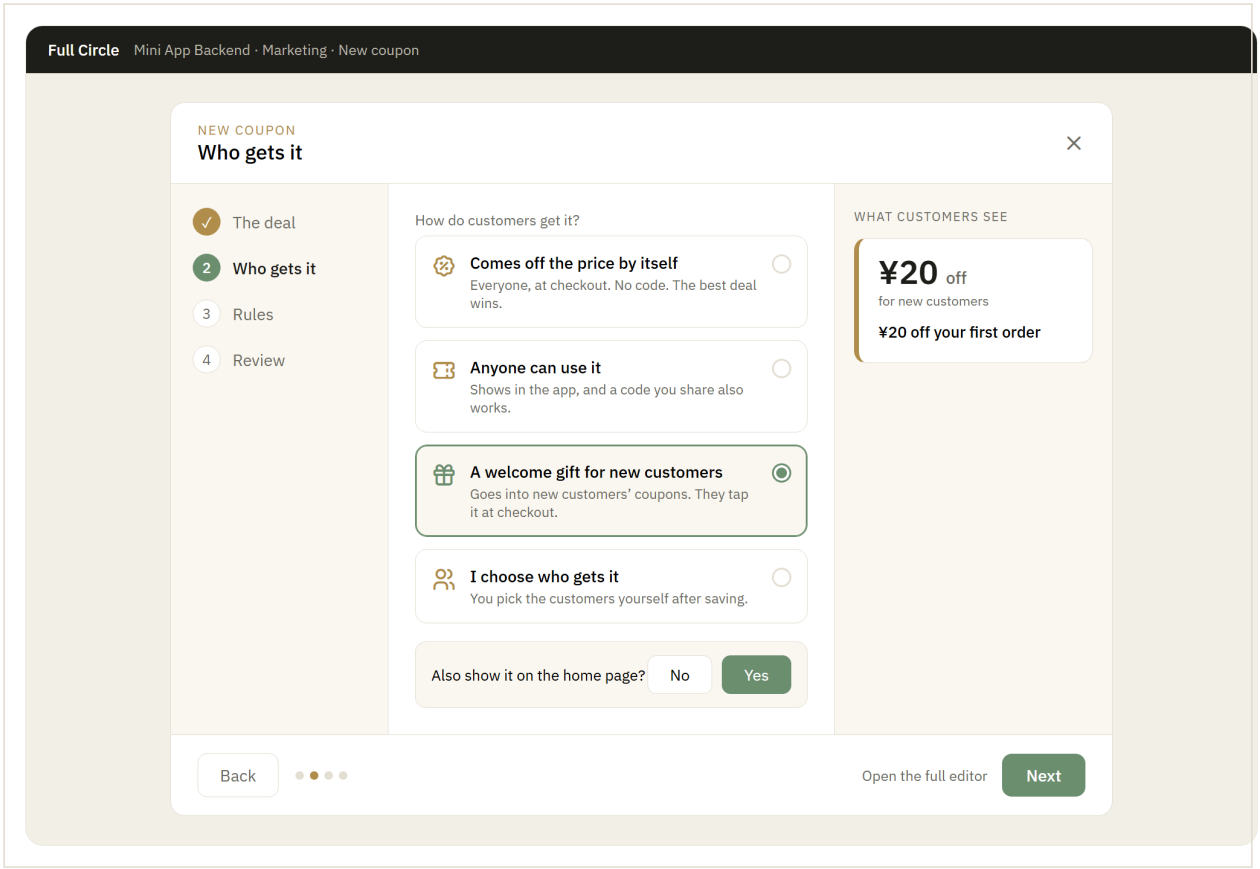

Ideas from your sales — the blank page becomes “pick a smart idea,” each with a real number.

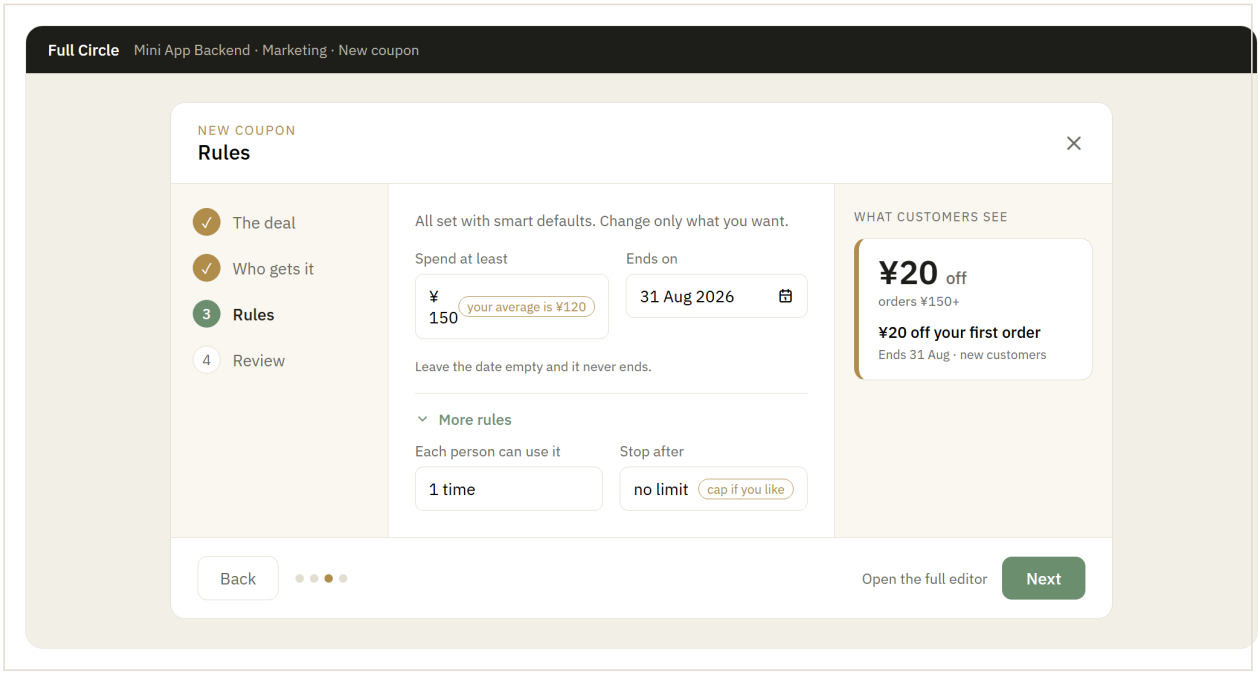

Describe it — one plain sentence, and the AI fills every box (code and label included).

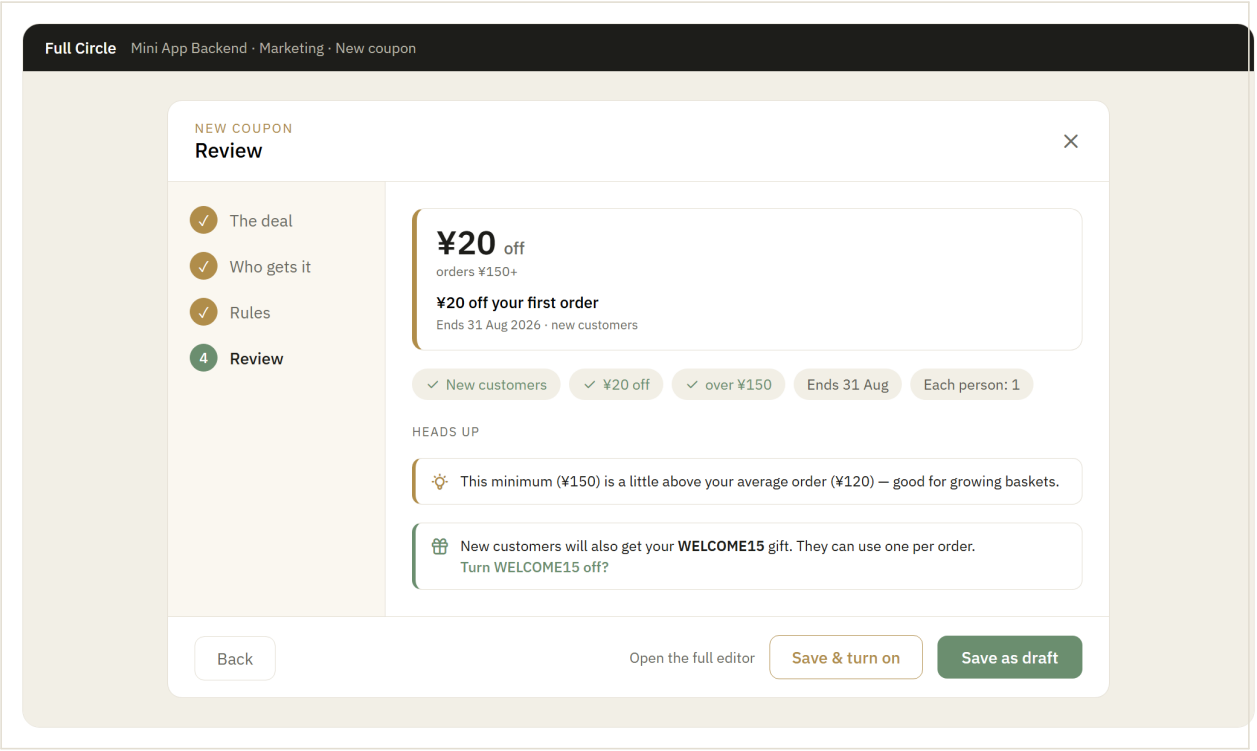

Step 1 — The deal. Pick the kind, type one number; the unit is built into the box.

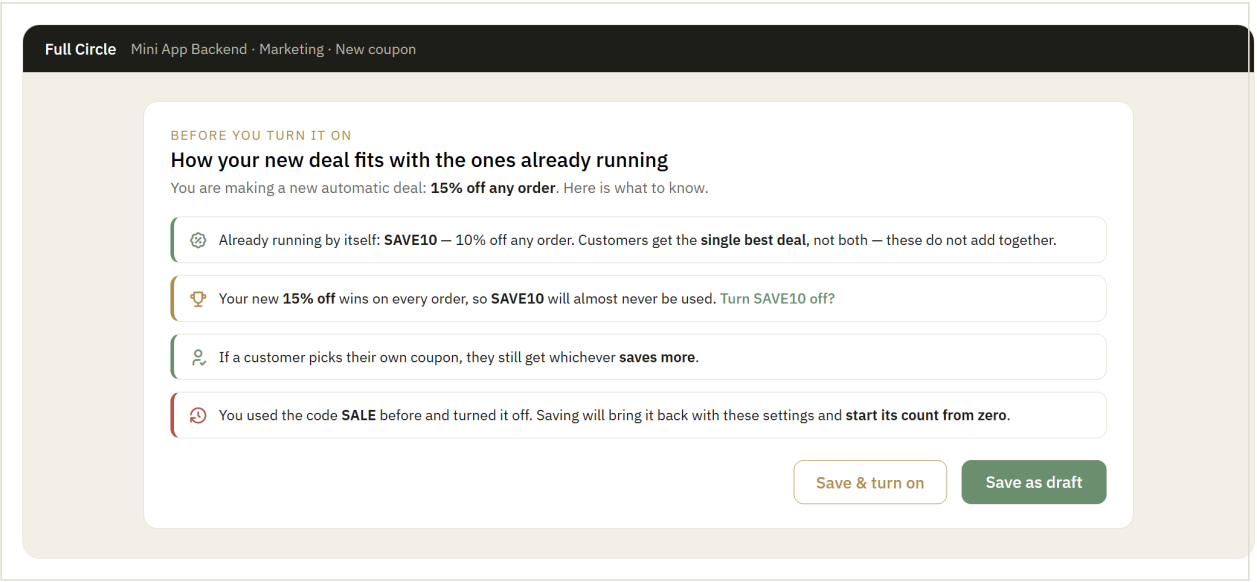

Step 2 — Who gets it. One plain choice replaces three confusing checkboxes.

Step 3 — Rules & dates. Optional, with smart defaults; the minimum is anchored to your average order.

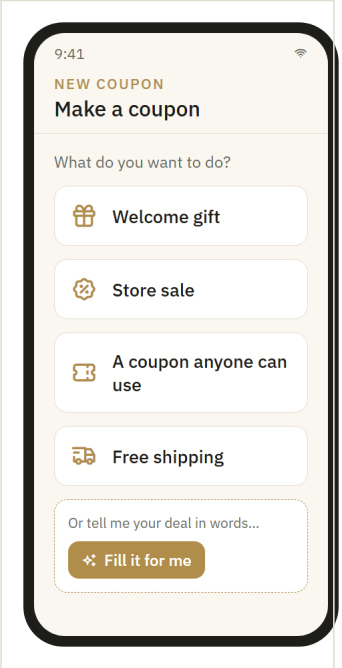

Step 4 — Review. See the real card, read plain heads-up notices, then save a draft or turn it on.

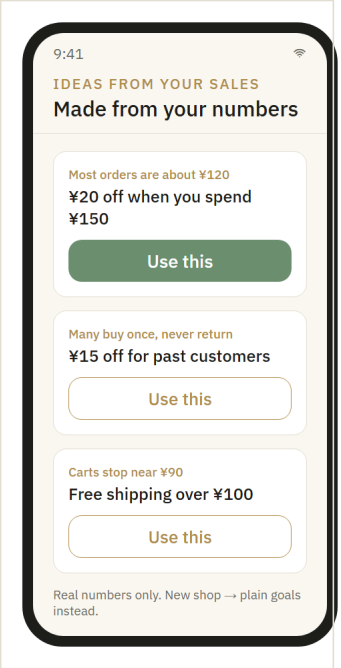

The smart heads-up — reads your live coupons and says, in plain words, what wins, what overlaps, what resets.

Phone flow — the same steps in your pocket

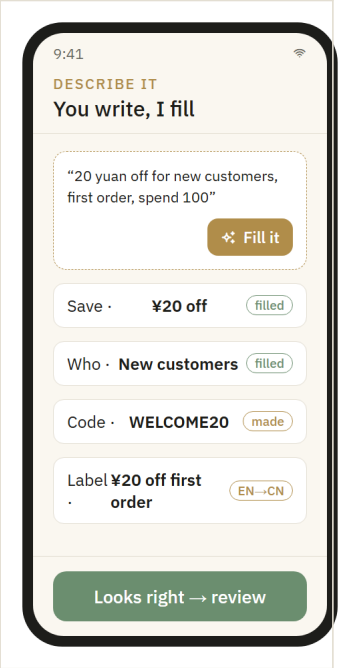

Each step on a phone, thumb-friendly — for operators making a coupon on the move.

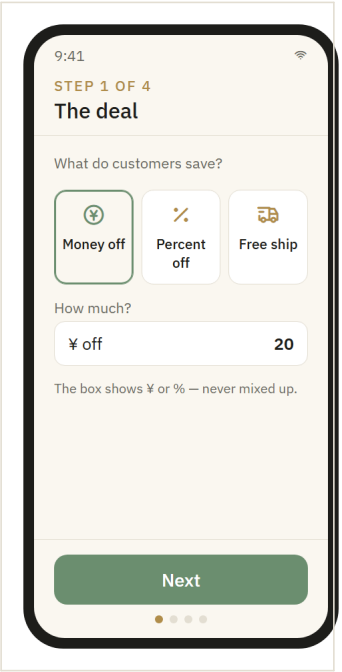

Front door

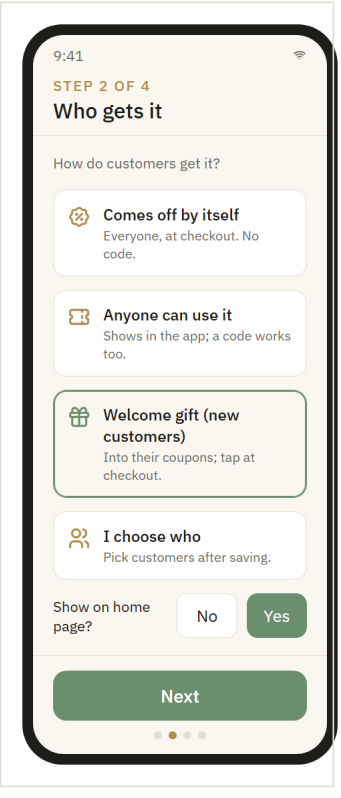

Ideas from sales

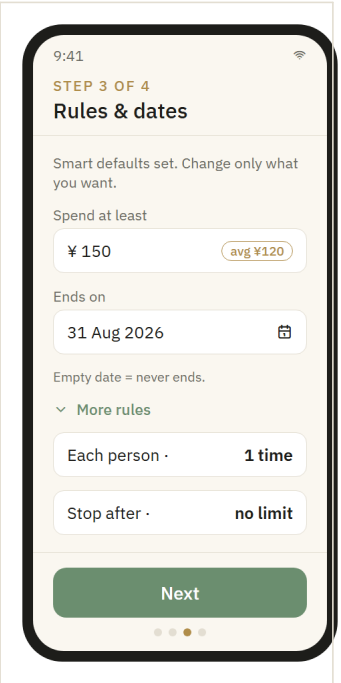

Describe it

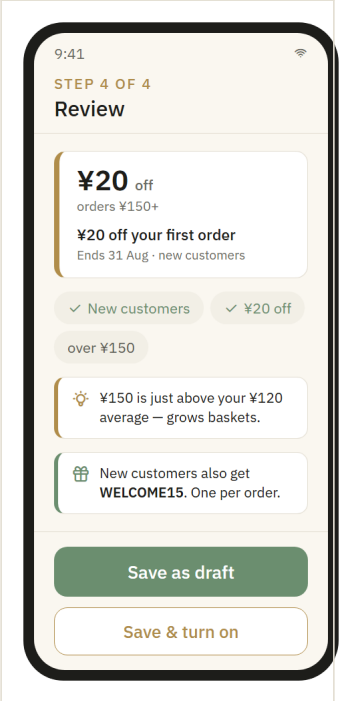

Step 1 · The deal

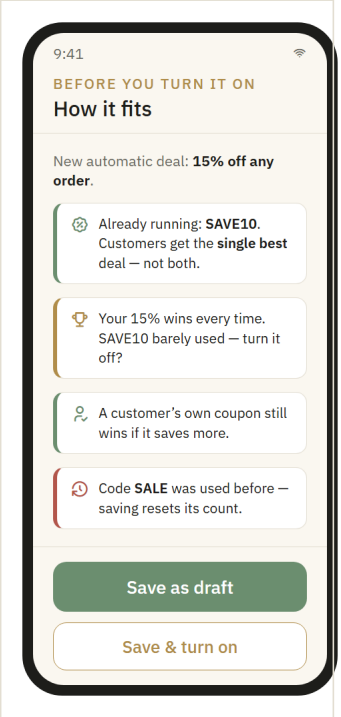

Step 2 · Who gets it

Step 3 · Rules

Step 4 · Review
